

THE ROLE OF SENSING FOR HEALTH AND WELL-BEING

Juan Carlos Augusto S.A., Lic., M.Sc., Ph.D.
Professor of Computer Science
Head of Research Group on the Development
of Intelligent Environments

Middlesex University
School of Science and Technology
The Burroughs, Hendon
London NW4 4BT

Department of Computer Science

email: J.Augusto@mdx.ac.uk
<http://www.jcaugusto.com>

Rome
22.02.24

Current computing systems can process a sophisticated combination of sensing data at great speed and with high impact outputs

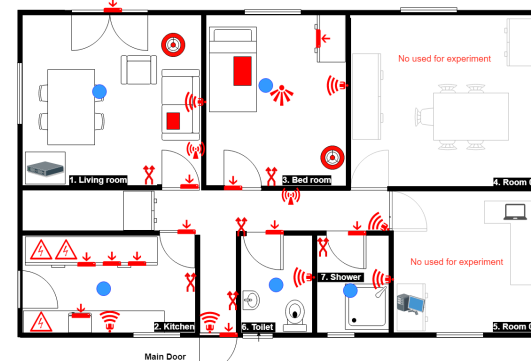

But... At what sort of quality level?

SENSOR DATA ACQUISITION

Technology is having a massive influence on how many different key services are deployed in society.

Sensing have become the back bone of the transformation or the creation of many of those services.

- Motion
- Door
- Energy
- Repeater
- Multisensor
- Pressure
- Lamp
- Light switch
- BLE Beacon
- Server
- Vera Hub
- Processing computer

TYPE OF SENSORS

Smart watches and Smart Phones will typically have these and more!:

- Accelerometer
- Gyroscope
- Magnetometer or Compass
- Barometric Pressure Sensor
- Body Temperature Sensor
- Heart Rate Monitor
- Oximetry Sensor
- Ambient Light Sensor
- Altimeter Sensor
- Bioimpedance sensor
- Proximity Sensor
- ECG Sensor
- Gesture Sensor
- UV Sensor
- Skin Conductance Sensor
- GPS Sensor in Smartwatch

But, are there any good?

Well...it depends for what purpose...

FOR EXAMPLE...

Let us consider a case that is sensitive: heart monitoring ...

Holter monitor

Electrodes

Holter Monitor

Holter Monitor

Smartwatch

A COMPARISON

Holster monitor:

- Bulky
- (very) Expensive
- Uncomfortable
- Very precise
- Better info for physician
- Healthcare standard
(UK-NHS approved)

Smartwatch:

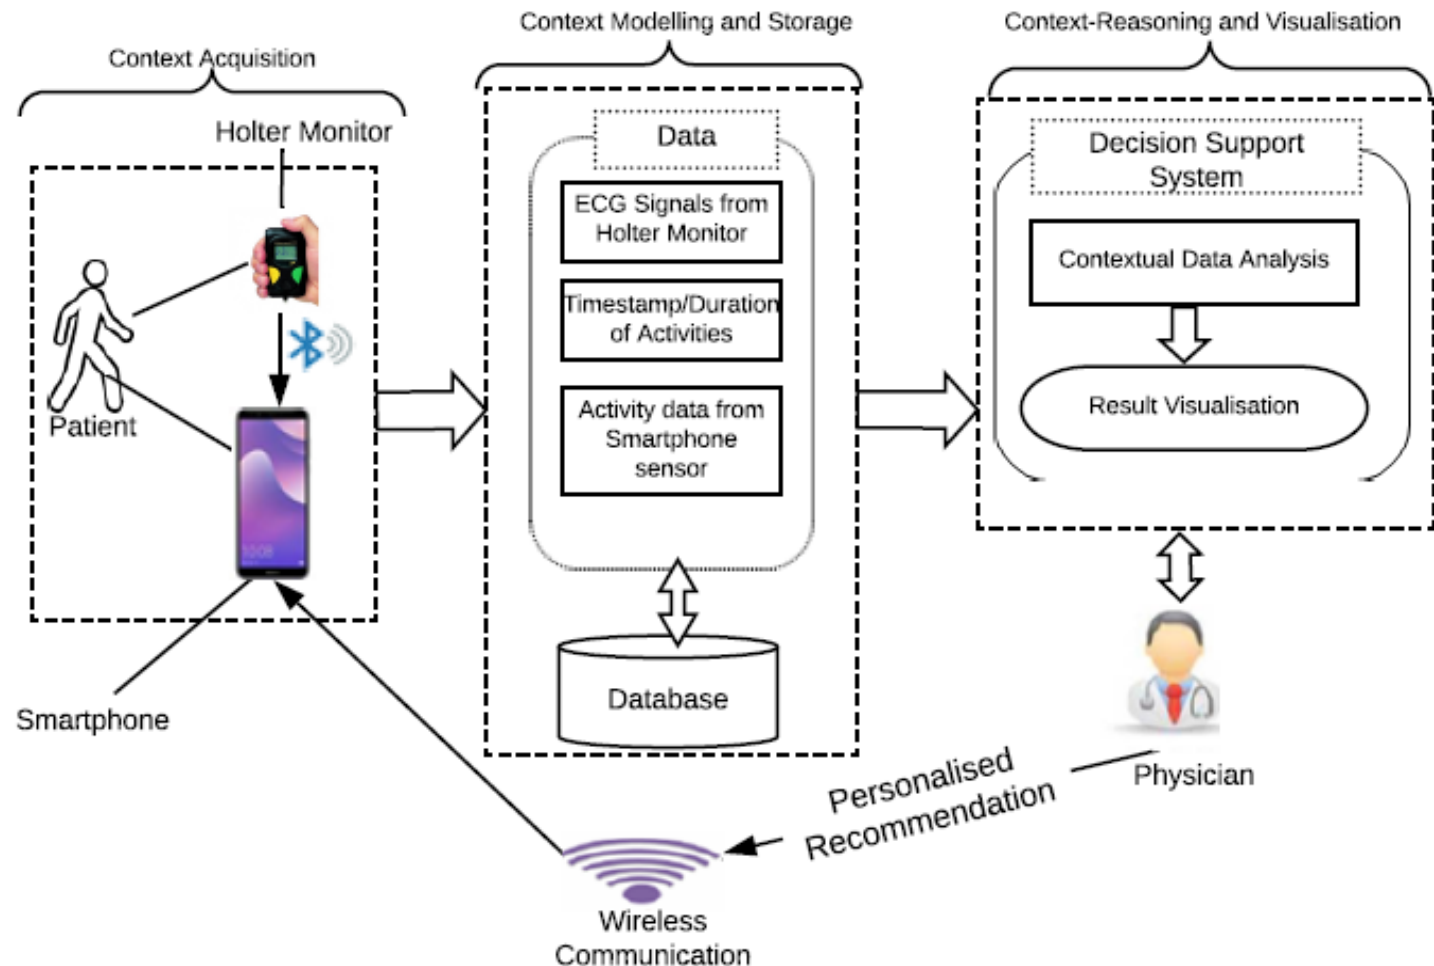

- Small
- (not so) Expensive
- Comfortable
- Not so precise
- Better info for user
- Not healthcare standard

CONTEXT-AWARE SUPPORT FOR CARDIAC HEALTH MONITORING USING FEDERATED MACHINE LEARNING

Context-aware Support for Cardiac Health Monitoring using Federated Machine Learning.

Godwin Ogbuabor, J. C. Augusto, R. Moseley, and A. van Wyk.
Proc. of 41th SGAI Int. Conf. on Artificial Intelligence (AI-2021). Cambridge, December 2021. Springer Verlag.

<https://repository.mdx.ac.uk/item/89803>

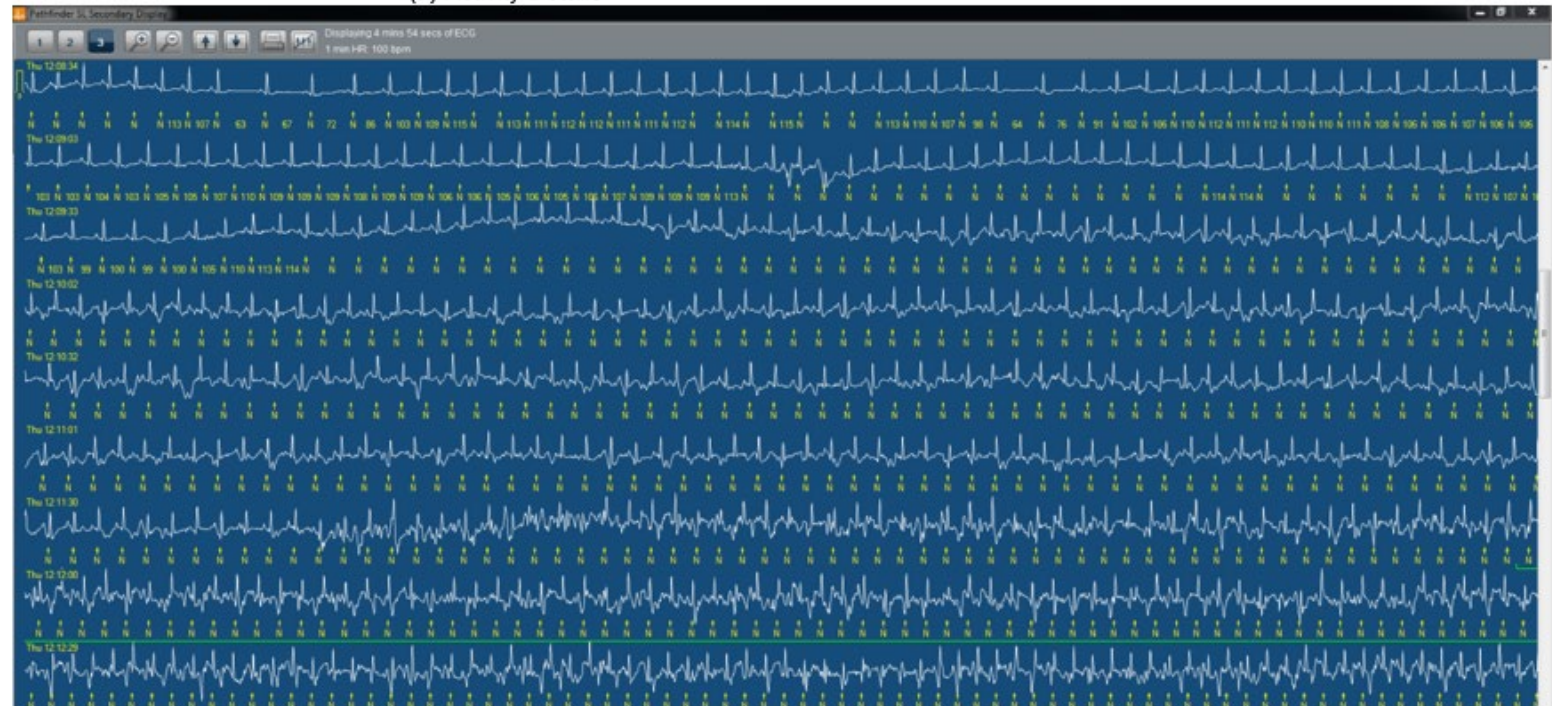

Combining/complementing the best of both technologies ...

Each data has a natural conceptual granularity...

(a) Activity Details

(b) ECG Signals

SOME POINTS ON PREVIOUS ANALYSIS

- As indicated initially there is a lot of different sensors at different standards (for example, NHS vs commercial).
- I am not suggesting research on wearables available to the public is not worth doing or that they are completely useless, it is what people make of it, e.g., the reasoning on extreme ways, especially unrealistically optimistic.
- The problem exceeds citizens believing their smartwatch is extremely accurate on delicate issues of health, also academics' believes on technical reports of experiments carried out with gadgets such as smartwatches for health with little evidence on the thoroughness of the reported (possibly inflated) positives (and possibly underplayed negatives).

Made in Middlesex

While you're at Middlesex, say "Yes" - Get involved in anything and everything and you'll really enjoy your time there.

DATA PROCESSING

Spoilt for choice, many approaches...

- Logic (non-monotonic, temporal, fuzzy, description,...)
- Probabilistic methods (Bayesian Networks, HMMs, Kalman Filters,...)
- Classifiers (decision trees, k-NN, SVM, ANNs,...)
- ML/NLP (un-/semi-/supervised learning, Large Language Models and Generative Pre-trained Transformers)

Each one with pros and cons...!

- Latest developments grabbing the attention of the media come from the data intensive systems: GPT-4 it is estimated to have been trained concerning more than 1 trillion parameters.
- That allows the system to create text and images resembling human production, still producing “hallucinations”.
- One problem being the quality of the input data

OTHER IMPORTANT AREAS ARE UNDERDEVELOPED

Despite the potential usefulness of LLMs based Generative AI, in health and well-being applications, other algorithmic and system qualities are also extremely important and are not so well explored, for example:

- * explainability

- * reliability

EXPLAINABILITY

```

ssr((CorridorMotion ^ prefLight) -> CorridorLight);
ssr((CorridorMotion ^ prefComfort) -> #CorridorLight);
ssr((BedroomMotion ^ BigPadIdle) -> BedRoomLight);
ssr((BedroomMotion) -> #BedRoomLight);
ssr((ToiletMotion) -> ToiletLight);
ssr((ShowerMotion) -> ShowerRoomLight);
ssr((CorridorMotion) -> #ShowerRoomLight);
    
```

Figure 23.: Argument tree for Corridor-Light “on” or “off”.

Figure 24.: Argument for BedRoom-Light.

Figure 25.: Argument for ShowerRoom-Light.

Using Argumentation to Manage Users’ Preferences.

C. L. Oguego, J. C. Augusto, A. Muñoz, M. Springett.

Future Generation Computer Systems, , 81 . pp. 235-243

(Elsevier). 2018.

→ Simulations

→ Properties (requirements)
verification or counter-examples

Example: Asthma Management System

Using Formal Methods to Guide the Development of an Asthma Management System. Juan Carlos Augusto, Mario Jose Quinde, Nawaz Kahn. Proceedings of 10th Int. Conf. on Dependable Systems, Services and Technologies Leeds, UK, June 5-7, 2019

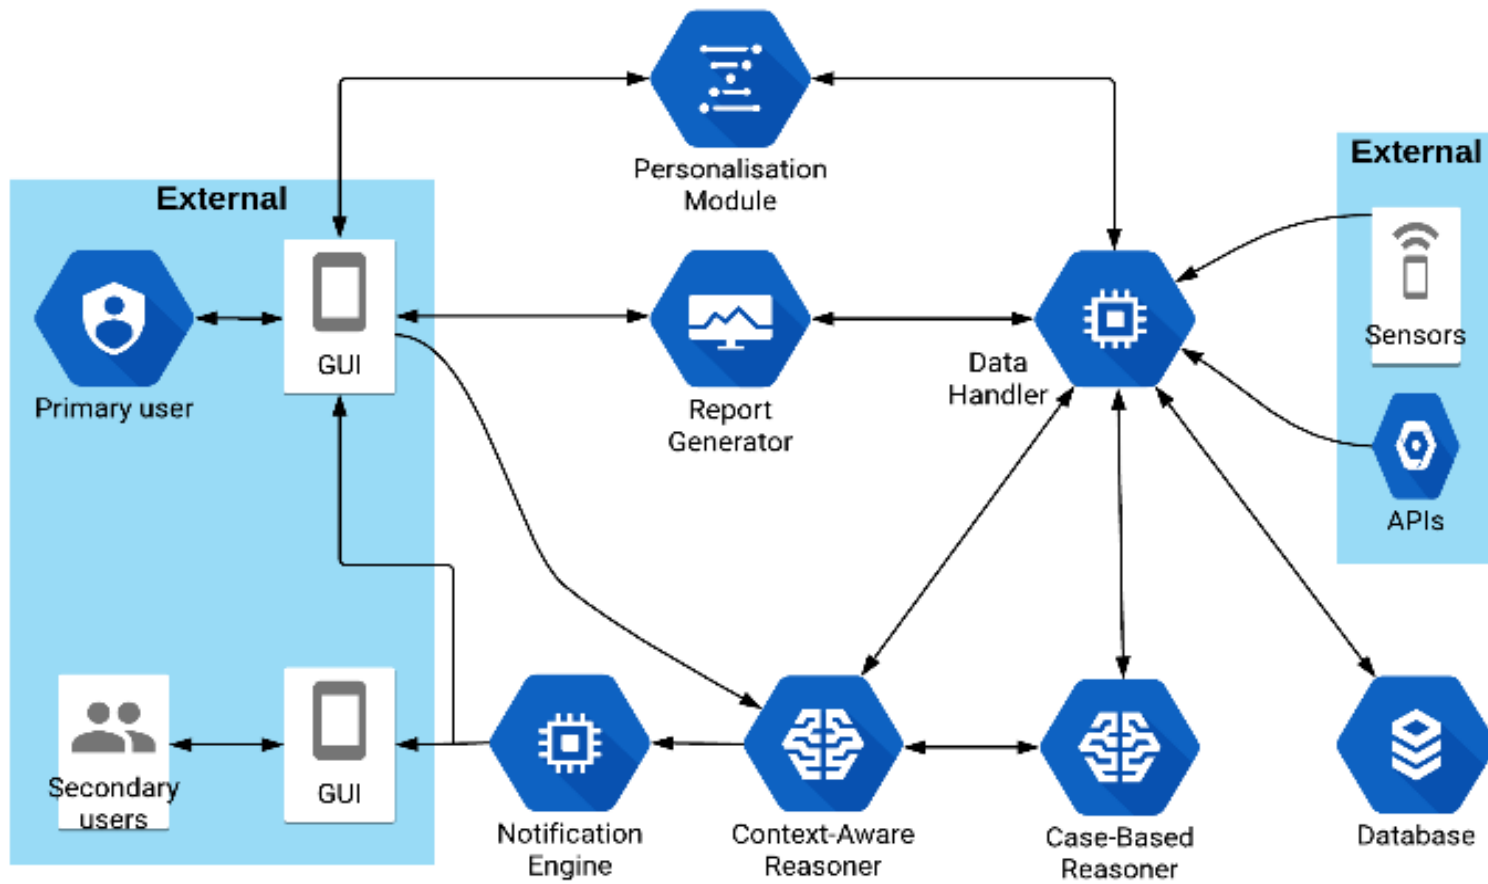

Your Control Tests

New Control Test

Time	PEF	Rescue puffs	Result
Wed, 10 Oct 18 3:08 PM	680	0	well controlled
Wed, 10 Oct 18 3:07 PM	580	0	not well controlled

Requirements

<p>1. The Personalization Module (PM) should allow users to customise the following features of the prototype:</p>	<p>a. The indicators that the system should track. (In case the triggers of the person with asthma are still not known, the system should track all the indicators that it possibly can.)</p> <p>b. The places where the system should track those indicators in case they are outdoor or indoor environmental indicators.</p> <p>c. The users that will have access to the context-related information of the person with asthma.</p> <p>d. The users that will receive notifications when the system detects a potentially risky situation.</p>
<p>2. The system Notification Engine should notify users (pull approach) when the C-A/CBR Reasoner detects a potentially risky situation based on the indicators-tracking personalization done by the user (1.a).</p>	<p>a. In case the triggers of the person with asthma are still not known, the C-A/CBR Reasoner should analyze the context based on previous situations that led the person with asthma to a deterioration of their health status.</p> <p>b. In case the triggers of the person are partially known, the C-A/CBR Reasoner should notify users depending on the indicators-tracking personalization (2), and it should also analyze previous situations that led to a deterioration of their health status (2.a).</p>
<p>3. The C-A/CBR Reasoner can be activated by the user (push approach) in case they want to know the possibilities of a risky situation to occur.</p>	
<p>4. The user should be able to ask the Report Generator subsystem to show a report based on the indicators-tracking personalization (1.a).</p>	<p>a. In case the triggers of the user are not known, the Report Generator subsystem should show a report about all the indicators that it is tracking.</p>
<p>5. The Data Handler subsystem should obtain context-related data from the APIs considering the indicators-tracking</p>	<p>a. The Data Handler subsystem should query the APIs every certain time.</p> <p>b. Every time the system obtain context-related data from the APIs, it should activate the C-A/CBR</p>

```

[queues, step 368]

p4: [] ((monitor && goingout && highPollenDetected) -> <> generate_notification)
(i.e., whenever the system is monitoring and user goes out of the house and high pollen has been detected then an notification is issued)

The screenshot shows the Spin Version 6.4.9 interface. The top menu bar includes options like Edit/View, Simulate / Replay, Verification, Swarm Run, <Help>, Save Session, Restore Session, and <Quit>. The main window is divided into several sections:

- Safety:** Includes checkboxes for invalid endstates (deadlock), assertion violations, and xt/xs assertions.
- Storage Mode:** Includes radio buttons for exhaustive (selected), minimized automata (slow), hash-compact, and bitstate/supertrace.
- Search Mode:** Includes radio buttons for depth-first search (selected) and breadth-first search, and checkboxes for partial order reduction, bounded context switching, and iterative search for short trail.
- Liveness:** Includes radio buttons for non-progress cycles, acceptance cycles, and a checkbox for enforce weak fairness constraint.
- Never Claims:** Includes radio buttons for do not use a never claim or ltl property and use claim (selected). A text field for claim name (opt) contains 'p4'.

Buttons for Run, Stop, and Save Result in: pan.out are visible. On the right, there are buttons for Show Error Trapping Options and Show Advanced Parameter Settings.

The terminal window shows the following output:

```

3 /* Behavioural Modelling:
4 modelling basic behaviour in first column of requirements table. Assume the
app has been personalized to be sensitive to Pollen. A user indicates a preference for r
eceiving notifications with pollen status, when the person is going out, if the pollen is d
etected to be high then it issued a notification. */
5
6
7 /* it shows that notifications are feasible however it also shows there are cycl
es whithni the system which may prevent the notification to be finally issued */
8 ltl p1 { [] monitor}
9 ltl p2 { [] goingout}
10 ltl p3 { <> generate_notification }
11 ltl p4 { [] ((monitor && goingout && highPollenDetected) -> <>
generate_notification) }
12
13
14 mtype = {input, notification_prefered, notification_not_prefered, hig
h_Pollen, low_Pollen, output};
15 /* communication between decision making core part of system and exte
rnal side of it (APIs, users, environments) */
16 mtype = {pm2dh, dh2pm}; /* type of communication between pm a
nd dh */
17 mtype = {rq2dh, dh2rq}; /* type of comunication between rq and d

```

The terminal also shows the command-line execution:

```

only one claim is used in a verification run
choose which one with ./pan -a -N name (defaults to -N p1)
or use e.g.: spin -search -ltl p1 s3-m4-v2.pml
gcc -DMEMLIM=1024 -O2 -DXUSAFE -DSAFETY -w -o pan pan.c
./pan -m10000 -N p4
Pid: 5240
pan: ltl formula p4

(Spin Version 6.4.9 -- 17 December 2018)
+ Partial Order Reduction

Full statespace search for:
never claim      + (p4)
assertion violations + (if within scope of claim)
cycle checks     - (disabled by -DSAFETY)
invalid end states - (disabled by never claim)

State-vector 100 byte, depth reached 863, errors: 0
832 states, stored
13105 states, matched
13937 transitions (= stored+matched)
2576 atomic steps
hash conflicts: 22 (resolved)

```

RELIABILITY - VALIDATION

There are no recipes out there that innovating teams can apply, each one reinventing the wheel and not sharing so there is no “good practice” arising developing... we have been exploring simple repeatable processes:

Pre-validation Steps

- Smart home infrastructure set up
- Ensure the DMMS is running (e.g., reasoning software, sensors hub, and Server)
- Determine Validation scenarios
- Carried out a physical check of all the equipment (including sensors)
- Access/Print Context Testing Tables
- Print validation scenario tables
- Print performance indicator tables
- Print validation error log

Active Validation Steps

- Familiarise participant with the smart home
- Explain the validation scenarios (Eat, Sleep, Indoor activity)
- Explain performance indicator tables for each scenario
- Go through the documents to be completed
- Perform a trial run of scenarios
- Carry out individual validation scenarios
- Carry out combined validation scenarios
- Participant completes validation scenario tables
- Participant completes performance indicator tables
- Document results
- End validation process

DATA AND CONTEXT

- Sensor data helps to define contexts of users. On the other hand the quality of the interpretation of sensor data is proportional to its wider context.
- So data and context are powerfully related, and we need to consider these inter-relation more carefully.
- However, for two decades colleague have been using a definition of context-awareness which is mostly technology-oriented.

CONTEXT-AWARENESS

A more human/stakeholder-centric view is needed:

- Context: *the information which is directly relevant to characterize a situation of interest to the stakeholders of a system.*
- Context-awareness: *the ability of a system to use contextual information in order to tailor its services so that they are more useful to the stakeholders because they directly relate to their preferences and needs.*

Systems should be conceived more explicitly to serve humans!

A Smart Environments Architecture (SEArch), J. C. Augusto et al. Applied Artificial Intelligence. Taylor and Francis. 2020.

Context-aware Systems Architecture (CaSA). J. C. Augusto et al. Cybernetics and Systems, Taylor and Francis. 2021.

This then more naturally capture what humans expect from an Intelligent Environment...

- Beneficiary Context Perception (BCP): is the context as perceived by the beneficiary, where Perception here is understood as measured with the available infrastructure.
- Beneficiary Context Expectations (BCE): are the services the beneficiary expects in a given context.

Hence an Intelligent Environment can be seen as one that should work to optimize the alignment of BCE and BCP in favour of the main beneficiaries.

They can be calculated in real-time:

- **$BCE(p_i, s_j, c_k, b; t)$** measures how a beneficiary (b) prefers (p_i) a contextualized (c_k) service (s_j) at a certain time (t),
- **$BCP(p_i, s_j, c_k, b; t)$** measures how that beneficiary perceives the actual delivery of that service, then we can define the level of *Service*

Achievement Satisfaction of an IE system for beneficiary b at time t is:

$$\mathbf{SAS}(IE, b, t) = \sum_{i=1..p; j=1..s; k=1..c} |BCE(p_i, s_j, c_k, b; t) - BCP(p_i, s_j, c_k, b; t)| = 0$$

That is the IE system should aim to achieve the best possible alignment of the user expectation with the user perception of system services at all times.

(A generalization $SASm(IE, B, t)$ for multiple users also available)

Contexts and Context-awareness Revisited from an Intelligent Environments Perspective.

J.C. Augusto. Applied Artificial Intelligence, Taylor & Francis (2022)

Contexts for Intelligent **E**nvironments (CIEn) Theory:

CIEn= $\langle B, S, C, Ops, A, OW \rangle$ where:

$B = \{B_1, B_2, \dots, B_b\}$ is a finite set of **beneficiaries**,

$S = \{S_1, S_2, \dots, S_s\}$ is a finite set of **services**,

$C = \{C_1, C_2, \dots, C_c\}$ is a finite number of **contexts**,

with $C_i = [Name, Beneficiary, Activation, Effect]$,

$Ops = \{Op_1, Op_2, \dots, Op_o\}$ is a finite set of context operations,

$A = \{Al_1, Al_2, \dots, Al_a\}$ a finite set of algorithms to process context information,

$OW = \{\dots OW_i \dots\}$ is a finite set of instances OW_i of observations of the real world.

More details in:

Contexts and Context-awareness Revisited from an Intelligent Environments Perspective.

PREFERENCES SHARING

“Managing Preference Profiles in Multi-user Intelligent Environments”.
Juan Carlos Augusto and Andrés Muñoz.
Proceedings of Citizen-Centric Smart Cities Services (CCSCS'2020) Workshop
20-21 July, Madrid, Spain.

SOME CHALLENGES AHEAD...

- How much information we will be willing to share with different smart environments (from which we do not know exactly their “real” policies): house, work, health, educational, entertainment, etc.
- How conflicting preferences will be solved?
- More on this towards the end...

- On the “Engineering Contexts” side of things we are behind what Industry needs.
- Many publications mention contexts and report on systems which use some sort of context related notion...
 - ... however, they are mostly ad-hoc, it is rarely explained how contexts are defined, designed, related, maintained, modified, etc.

For more on this see:

Engineering Context Updates. Juan Carlos Augusto. Proceedings of Citizen-Centric Smart Cities Services Workshop (CCSCS'2022). Biarritz, France. 20-21 of June, 2022.

TECHNOLOGY AND SOCIETY

Tesla's Privacy notice states:

"Your privacy is and will always be enormously important to us." ... "Tesla vehicles are equipped with a camera suite designed from the ground up to protect your privacy" www.tesla.com/legal/privacy

However, in 2023 it emerged during 2019-2022 Tesla workers have been sharing images of:

- car owners walking naked in the garden
- Road accidents where a child in a bike was hit by a Tesla car
- Some pictures captured by the cameras were turned into memes and circulated internally

Tesla says after this was discovered Tesla cars terminated the feature which allowed cars to send recorded videos to Tesla if the user consented in the initial agreement.

If a company with the resources of Tesla and the commitment to privacy stated above does this, what can we expect from the rest... (most of which have generic privacy statements just to cover themselves legally but says nothing specific nor reassuring).

And... did they not know this could happen?

Why do we want to gather sensor data?

The introduction of technology has to be sensitive to the user and abide to the principle that the human is the master and the computer the slave and no the other way round (Dertouzos, 2001)

Michael Dertouzos (2001) Human-centered Systems.

Chapter in: The Invisible Future. P. Denning (editor) ACM Press, USA, pp 181–192.

THE 9 PRINCIPLES FOR I.E.

P1) to be intelligent to recognize a situation where it can help.

P2) to be sensible to recognize when it is allowed to offer help.

*P3) to deliver help according to the needs and preferences of **those** which is helping.*

*P4) to achieve its goals without demanding from the **user/s'** technical knowledge to benefit from its help.*

*P5) to preserve privacy of the **user/s**.*

*P6) to prioritize safety of the **user/s** at all times.*

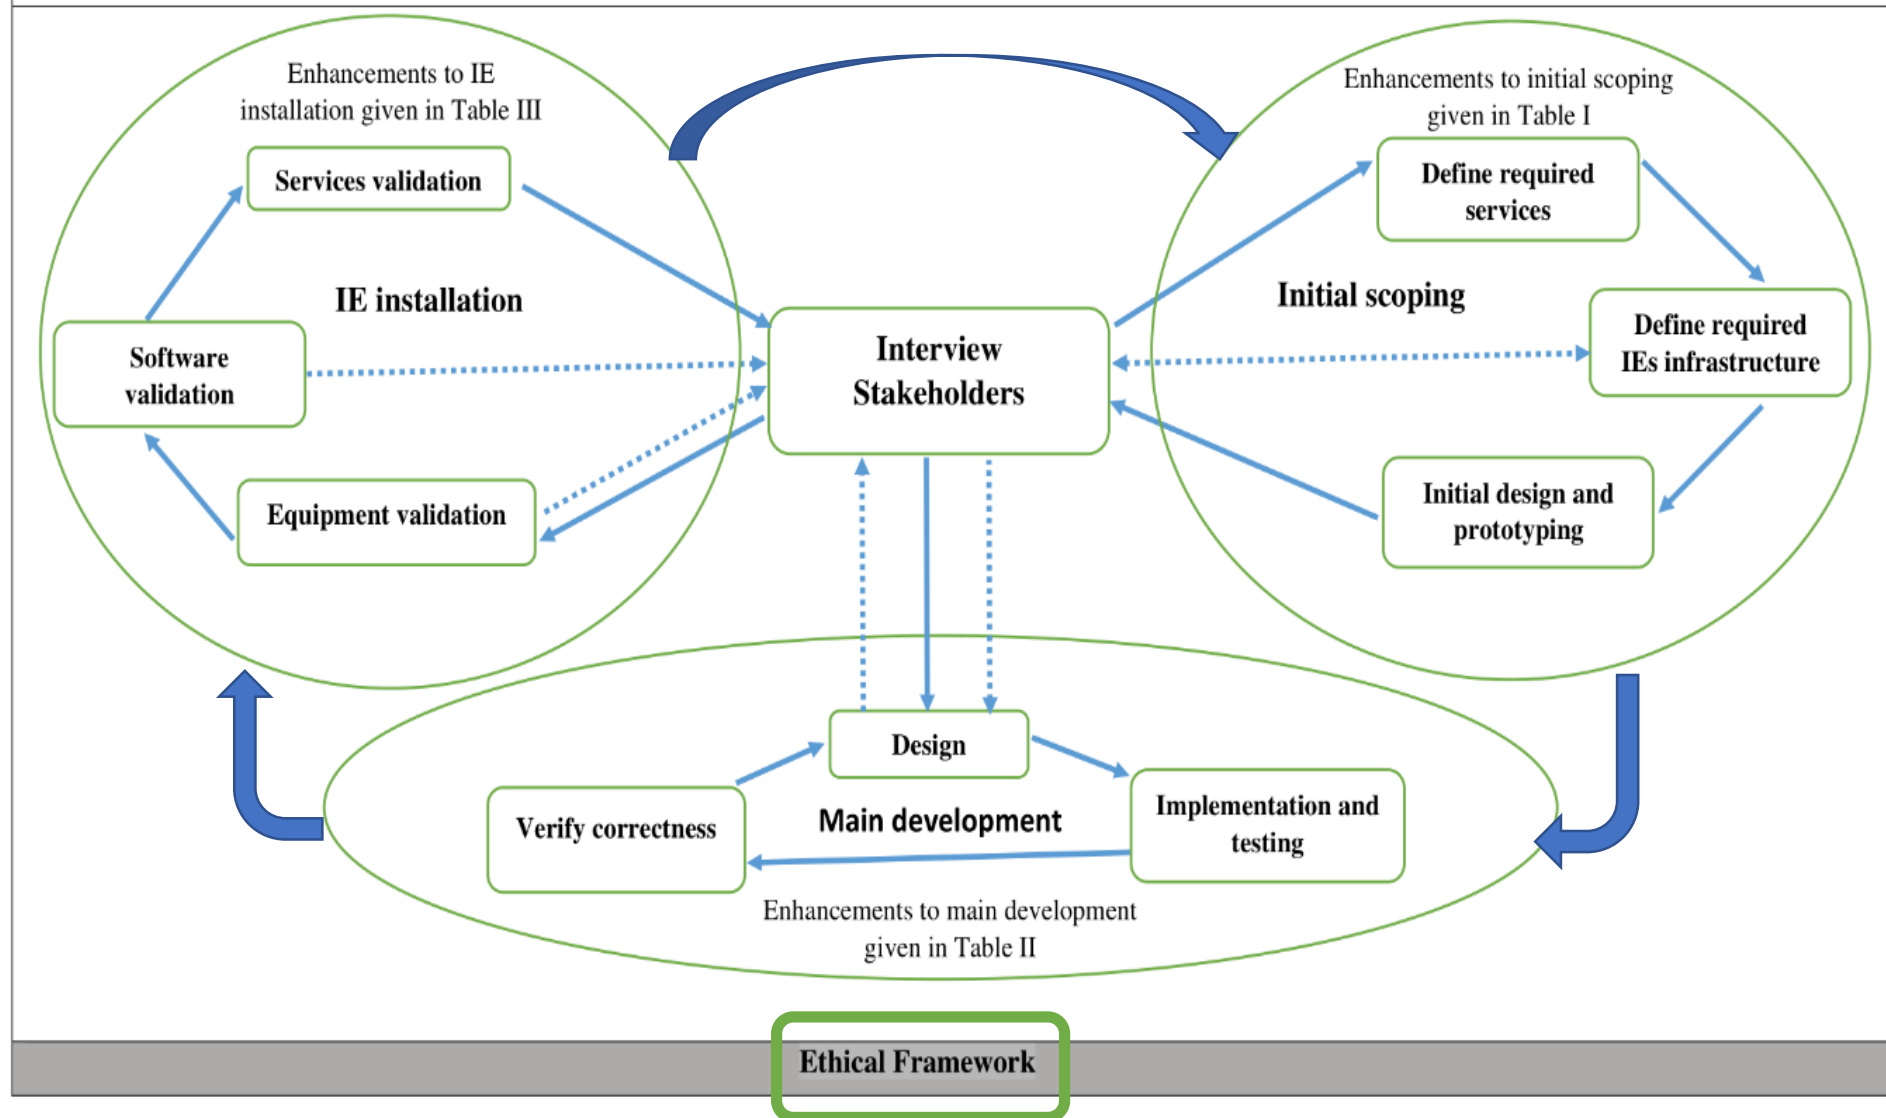

P7) to have autonomous behaviour.

*P8) to be able to operate without forcing changes on the look and feel of the environment or on the normal routines of the **inhabitants'** environment.*

*P9) to adhere to the principle that the **user** is in command and the computer obeys, and not viceversa.*

eFRIEND: A PRACTICAL GUIDE FOR DEVELOPERS

Generic Principles	Examples
Non-Maleficence and Beneficence	System should proactively help and assist users
User-Centred	Systems should be customisable to individual needs, preferences and requirements
Multiple Users	System should be aware of different needs and preferences of all individuals in a multi-user environment
Privacy	Users decide on, and can change, the level of acceptable recording, monitoring and tracking of activities
Data Protection	Users can determine level of information disclosure
Security	Provide adequate security measures and standards, appropriate to different environments
Autonomy	Freedom to customise, adjust, override, switch off
Transparency	To inform users of the pros and cons of the services
Equality, Dignity and Inclusiveness	Help, regardless of age, technical background and ability

eFRIEND: an Ethical Framework for Intelligent Environment Development. Simon Jones, Sukhvinder Hara, Juan Carlos Augusto. Ethics and Information Technology (17)12. March 2015, Springer.

EU Project POSEIDON had 60+ ethical requirements

Ah! Requirements have to be tracked into final product!

eFRIEND IN PRACTICE...

CONCLUSIONS

- **As usual the problem is not in the tools but on what humans make of them**
- So we have seen there are shortcomings at all stages:
 - Sensors data acquisition
 - Sensor data processing
 - Interface between system and society
- Of course there has been progress and benefits: early diagnosis, fitness apps encouraging healthier lifestyles, etc.
- Despite the lack of engineering tools some systems have been built, however we need to improve their quality. At all stages, from regulations onwards, more interaction with AI/SE/HCI.
- Currently data being processed is mostly physiological. What will happen when machines (and companies) know more about individuals' stressors and fears?
- In the fourth helix of innovation: companies and politicians are not best placed to look after the common good, citizens and academics are, and we have an important historical role here on making innovation safer.

**ONE WAY YOU CAN IMPROVE THINGS IS BY CONTRIBUTING
